PART ONE

The need of the hour

Indian income tax assessment moved onto a portal. The practice that serves it largely did not. Everything in this product follows from that gap.

Assessment is no longer a conversation. It is a clock.

Faceless assessment and faceless appeal removed the officer you could ring, the counter you could visit, and the adjournment you could ask for across a desk. What replaced them is a queue of dated documents on a website.

SERVICE IS DEEMED

A notice is served the moment it is uploaded to the e-filing portal and pushed to the registered email.

Whether anyone opens it is not the department's problem.

WINDOWS ARE SHORT

Compliance notices routinely allow **7 to 15 days**. An e-proceeding closes on the date printed on it. There is no counter open the next morning.

PROCESSING IS AUTOMATIC

CPC processes returns u/s 143(1) and makes adjustments without asking. Each intimation starts **its own rectification and appeal clocks**.

THE PENALTY IS STRUCTURAL

A missed notice is not a rebuke. It is best-judgment assessment u/s 144, penalty proceedings, and a demand that becomes **recoverable while you argue**.

The asymmetry that defines the problem: the department's side of this is fully automated and never forgets. The practitioner's side is a person, a browser tab, and a memory of which client mentioned what.

Five ways a matter is lost today — none of them careless

1 · The notice reaches the client, not the professional

Service goes to the assessee's registered email and portal account. The client does not read the portal; they forward the email a week later, or after the hearing. The one person who could have acted was never told.

2 · Nobody logs into three hundred portals every morning

A working practice carries hundreds of PANs. Checking each e-filing account daily is the only reliable way to see a notice on the day it issues — and it is physically impossible by hand.

3 · One matter lives in four places

Portal PDFs in a downloads folder, instructions on WhatsApp, the reply in email, the hearing date in a diary. Nothing joins them, so context is rebuilt from scratch at every step — and lost entirely at every handover between staff.

4 · Limitation is counted by hand, from a date somebody has to find

Thirty days, sixty days, from service or from communication — computed off an order buried in a folder. A date computed one day late is an appeal that no longer exists.

5 · The work is done and never billed

Fees, receipts and outstanding follow-ups sit in a wholly separate system from the matters that generated them — so recovery depends on whoever remembers.

From 1 April 2026, two limitation regimes run side by side

The Income-tax Act, 2025 does not merely renumber the sections. It changes the shape of the arithmetic every appeal deadline is computed with.

APPEAL	ACT, 1961	ACT, 2025
To CIT(A)	30 days from service	1 month from the end of the month of service
To ITAT	60 days from communication	2 months from the end of the month of communication

Which clock applies is decided by when the order was communicated — not by the assessment year. Limitation is procedural. An order communicated in June 2026 runs on the new Act even though the assessment it decides relates to A.Y. 2017–18. So for years to come, a single practice will hold live deadlines on both regimes at once.

WHAT PROHIPPO DOES ABOUT IT

- **Computes both** regimes for every appealable order, always — never only the one it thinks is operative.
- **Marks which one governs** and shows the date arithmetic on screen, so it is checkable rather than trusted.
- **Lets the practitioner override the communicated date** to force either regime, for the cases where service is disputed.
- Keeps the rules as **data in one file**, so a statutory change is an edit, not a rebuild.

The error that matters is one-directional

A deadline shown **earlier** than the true one costs a few days of comfort. A deadline shown **later** than the true one costs the appeal. The engine is built around that asymmetry — it shows both computations rather than quietly picking one.

PART TWO

One matter. One unbroken journey.

ProHippo watches the whole arc — the notice issuing, the alert reaching a human, the hearing entering a calendar, the reply going out, the order starting a countdown, the appeal being filed — and keeps every step attached to the matter that created it.

Notice → Appeal, without a handover that loses context

01 · NOTICE DETECTED

The notice is issued

ProHippo starts watching the matter the moment a digital notice leaves the Department — picked up by portal sync, not by somebody checking.

02 · INBOX MONITORED

Email misses it. ProHippo does not

The assessee can leave the mail unopened. The deadline still appears on the dashboard and in the queues that count.

03 · USER ALERTED

The right alert reaches WhatsApp

Matter, assessment year and due date, delivered where attention already lives — to the practitioner, and where consented, to the client's group head.

04 · CALENDAR SYNCED

The hearing books itself

The hearing date is read off the notice and written into a Google calendar ProHippo creates, with the matter attached.

05 · HEARING READY

The reminder arrives on time

A WhatsApp reminder the day before, a weekly cause list every Monday, and a printable cause list for any range of dates.

06 · REPLY SUBMITTED

Type. Review. Submit

Documents are called for as a tracked checklist, in the client's own language, and the reply filed on the portal is synced back onto the proceeding.

07 · WINDOW OPEN

The order starts a live countdown

Every appealable order becomes a prepared appeal: deadline, regime, fee, checklist and a pre-filled form worksheet.

08 · PORTAL CONFIRMED

The appeal closes the loop

The Form 35 filed on the portal syncs back into the same matter — acknowledgement, date and documents in one place.

Always visible

No notice gets buried.

Always moving

No handoff loses context.

Always on time

No deadline becomes a surprise.

Four surfaces, one record of truth

WEB & MOBILE

The ProHippo app

- React 19 + Vite single-page app at **prohippo.in**
- Installable as a **PWA** on desktop and phone — own icon, own window, service worker
- Full mobile layout: drawer navigation, tap-through cards, **haptic touch feedback**
- Sign in by **mobile OTP, email OTP or Google**

BROWSER

ProHippo Sync — Chrome extension

- Opens the e-filing portal **already logged in** for any assessee
- Drives an on-demand sync from the practitioner's own browser and IP
- Streams notices, orders, replies, Form 35 and returns back into the app live
- Downloaded from inside the app — always the version the app expects

DESKTOP

ProHippo Connector

- Electron + Playwright app for **macOS and Windows**
- Syncs **many PANs in parallel**, each in an isolated browser session
- **Unattended**: starts with the machine, re-runs on a jittered timer
- Signs in from a device key held in the OS keychain

CLOUD

Firebase backend

- Per-user Firestore + Cloud Storage; rules deny cross-account reads outright
- **~40 Cloud Functions**: ingest, parse, compute, deliver, schedule
- Integrations: WATI (WhatsApp), Google Calendar, Sarvam (voice), Resend + 2Factor (OTP), Gemini (document reads)
- Multi-region, warm instances on the sync path

Why both an extension and a desktop app. The extension is zero-setup and runs when the practitioner is there. The Connector is for the practice that carries hundreds of PANs and needs the morning's notices already in before anyone sits down — parallel, paced to look human, and running on the firm's own residential connection rather than a data-centre IP.

PART THREE

Navigating the app

Every page, every tab, every facility — in the order a practitioner meets them.

The sidebar — eleven doors, and what is behind each

PRACTICE			
Dashboard	The morning screen: what landed, what is unanswered, what is due, what is owed.	Communications	Document requests as tracked checklists, plus the full delivery log.
Assesseees BADGE · COUNT	The client register, and the door into every individual file.	Intimations	Every s.143(1) and s.154 order, and what CPC did to each assessee's position.
Matters	Every proceeding across the practice — sortable, filterable, from notice to disposal.	Reports	Eight one-click CSV exports across the whole practice.
Hearings BADGE · NEW TRIBUNAL MAIL	Five calendar views, the ITAT inbox and the printable cause list.	TOOLS	
Appeals BADGE · APPEALABLE ORDERS	The limitation engine: countdowns, fees, checklists and pre-filled forms.	Sync Connector App	Download and first-run instructions for the desktop syncing app.
Invoices	Billing, receipts, ledgers, group accounts and the outstanding position.	Settings	Practice profile, account, data and every integration switch.
		Admin console PROHIPPO STAFF ONLY	A separate shell at /admin — invisible to practitioners, and blind to their client data.

Below the nav: the firm card — practice name, signed-in identity and sign-out — so it is always clear whose data is on screen.

Four numbers that open into the work behind them

The dashboard opens with a greeting, a practice-wide search on PAN or assessee name, and a one-line brief — how many hearings this week, how many notices await review.

Active matters

Every proceeding not closed or decided, against the total ever opened. Opens the Matters page.

Hearings this week

Seven-day count, with how many fall inside the next 48 hours. Opens the calendar.

Notices last 24h

What issued today and yesterday — the portal dates notices to the day, so the tile says so.

Awaiting reply

Issued in the last 15 days with no reply on record, flagging how many are already past due.

A number nobody can open is a number nobody can act on

Each of the last two tiles opens the notices behind it — assessee, section, assessment year, issue date, the count of files that came with it, and a due-date pill that turns red when it has passed. From a row you can open the PDF, or jump straight into the **proceeding** the notice belongs to rather than the notice on its own.

Search that goes somewhere

Typing a PAN or a name and pressing Enter lands on the assessee register already filtered. The **Desktop app** button installs ProHippo as a real application, and the user chip carries the practice identity through every screen.

The cards below the fold

APPEALS · FILING DEADLINES

Silent when nothing is due. When something is, it leads with the nearest deadline — client, route, days left, and the date — and **turns red inside seven days or once lapsed**. Counts how many fall within fifteen days and how many have already gone. One tap adds the deadline to the task board.

Notices · awaiting review

Recent notices, or ones with a hearing coming. Read the PDF, open the record, ask the client for documents, and tick as read — individually or in bulk.

Upcoming hearings

The next four, each with a date block that turns amber at four days and red at one: assessee, authority, bench, assessment year, section, time, and a video-conference marker. One tap turns a hearing into a task.

Receivables — group-wise

Outstanding professional fees rolled up by client group, as a ranked bar chart, so the collection call is aimed at the family or business house rather than a single PAN.

Mini calendar

The month at a glance with hearing days dotted, month-by-month navigation, and a jump into the full calendar.

Authority-wise matters

A donut of the active load — Scrutiny, CIT(A), ITAT, Penalty — with counts, so the shape of the practice is visible without running a report.

Tasks & notes board

A Keep-style board of pinned notes and checklists in seven colours, with due dates, client labels and archiving — fed directly by the hearing and appeal cards above.

The register — and the group, which is how clients actually exist

Every client on file

Name, PAN, status, assigned staff, mobile, email, address and date of birth or incorporation — searchable, filterable, and openable into a full profile. Bulk selection allows a **multi-PAN portal sync in one run**.

Groups: a family or a business house

Members are gathered under a named group with its own colour. A group carries a **head** — the person who actually answers for the companies and trusts inside it — with their own mobile and a recorded WhatsApp opt-in. Group billing, group ledgers and group payments all follow from it.

Why a head, and not the assessee

You do not WhatsApp a private limited company. You WhatsApp the person who answers for it. The head is picked from the group's own members in one click, so the number is copied off a profile rather than retyped — because two spellings of one mobile is how a client who opted out still gets messaged.

OPENING A PROFILE

A violet header carries the client's identity, PAN, group and status, with call, WhatsApp and email buttons, plus **New matter** and **Edit**. Four mini-statistics sit beneath it: active matters, upcoming hearings, outstanding fees, notices on file.

The eight tabs

Overview Returns Matters Hearings Notices Invoices
Communications Notes

Everything ProHippo knows about one client, in one place, without leaving the file. Clicking a matter or a hearing anywhere else in the app lands here, on the right tab, with the right card already open.

The eight tabs, one by one

Overview	A recent-activity timeline, upcoming hearings, the full particulars card, a financial-year ledger snapshot, and the Income-tax portal card that runs the sync.
Returns	Every assessment year on file: form and filing type, filed and e-verified dates, portal status, demand or refund, and downloads for the ITR JSON, the ITR-V and the full form — plus one-click Computation of Income .
Matters	Each proceeding as a card with a coloured stripe by type, expanding to the whole file: every notice and order in it, replies filed, hearings listed, documents attached.
Hearings	This client's dates — past and upcoming — with authority, bench, section, mode and the staff member holding it.
Notices	Every notice and order on file with DIN, section, issue date, response due date and the PDFs that came with it. A single s.148 often arrives as four files; the count is shown so nobody reads one and assumes that was all of it.
Invoices	Bills raised for this client, what has been received, what is outstanding, and payment entry with a receipt PDF.
Communications	Document requests — what was asked for and what is still outstanding — and a message log of every email and WhatsApp hand-off with its real delivery status.
Notes	Free-form practice notes against the client, kept with the file rather than in someone's head.

The rule the whole app follows: every record — matter, hearing, notice, invoice, message — is linked to an assessee profile. Nothing floats free, which is why any row anywhere can be traced back to the file it belongs to.

The card that does the fetching

Every filed return, and what CPC did to it

The year-by-year table

- **A.Y.** and **form**, flagged where the filing was revised, defective, updated or condoned
- **Filed on**, and whether it was e-verified and by what mode
- The portal's own **status description**, verbatim
- **Demand or refund** as computed — a blank cell and a genuine nil are shown differently
- Downloads: **JSON · ITR-V · Form**, each named properly on the way out

When a document cannot be opened, it says why

"Add the date of birth to unlock", "the date on file doesn't unlock this PDF", "the portal only sends this one by e-mail for A.Y. 2016–17 and earlier". The practitioner is told whether it is theirs to fix.

THE VARIANCE LINE

Under each intimation or rectification order, one sentence saying what it did to that year's position — **a signed rupee figure, green or red**, against the baseline it is measured from. A s.154 order is measured against the intimation it rectified; a s.143(1) against the return as filed. The baseline is part of the sentence, never a tooltip, because the same figure otherwise describes two different events.

Where the numbers come from

CPC's figure is read from the order's **status**, never by netting two fields against each other — because when a refund is set off u/s 245 the portal populates both, and netting them reports a demand on an order that says "there is no payment due". Where the portal sent no amount at all, the order's own printed total is used and **labelled as such**. An unrecognised status reports "could not be compared" rather than guessing.

Every proceeding in the practice, from notice to disposal

The list

One row per proceeding, sortable on every column and filterable by type and status. A row opens the assessee's file at that proceeding's card, expanded — because somebody clicking a matter wants the whole file, not a summary of it.

What a matter carries

Assessee & PAN Assessment year Section Authority / bench ITA number

Assigned staff Status Portal proceeding ID

Created two ways

By hand for a matter that arrived on paper — or automatically, by the portal sync, which keys each proceeding to its portal request ID so a re-sync updates the same matter instead of creating a second one.

SIX TYPES

Scrutiny CIT(A) ITAT Penalty Rectification High Court

FIVE STATUSES

Active Pending Submitted Decided Closed

Each type has a colour, everywhere

The same accent runs down the left edge of a row, across the modal header and through the dashboard donut — so a scrutiny, an appeal and a penalty read apart at a glance without anyone reading a word.

Five views of the same week, and a sheet you can carry in

THE FIVE VIEWS

- **Calendar** — the month, hearings on their days
- **Week** — the working week, hour by hour
- **List** — everything, newest first
- **Authority-wise** — grouped by forum, with the bench spread
- **Staff-wise** — who is holding what

Filter chips across the top narrow any view to Scrutiny, CIT(A) or ITAT.

Adding a hearing

Assessee, PAN, A.Y., authority, bench, section, date, time, mode (physical, video conference or e-proceeding), ITA number, staff and status — with the option to keep this one out of the Google sync.

The cause list

A printable PDF of the week's hearings — or any range of dates you choose — with everything needed to walk into the room: **who, before whom, which year, under which section, and whether it is by video**. Brand-typeset, one line per matter, in the order they are called.

Also on this page

- A **Google sync chip** showing when the calendar last mirrored
- **Export CSV** of the filtered set
- Counts of what is upcoming and what falls inside 48 hours

The ITAT inbox sits above the calendar

An email waiting to be confirmed is a hearing that is **not yet on any view below** — which is exactly why it is placed above them. Each row shows what the parser read: appeal number, appellant, A.Y., PAN, hearing date and time, bench, filing date and case type.

Nothing applies itself

A practitioner presses **Confirm** and the matter or hearing is written; the assessee it matched can be corrected first. An address that receives mail from the internet can be sent a convincing forgery, and a wrong date in a diary is the mistake this app exists to prevent. The card renders nothing at all when the queue is empty.

Reading a notice, and turning it into work

The record

Assessee, PAN, assessment year, section, authority, DIN, notice date, response due date and hearing date, whether it is an order, and the documents attached to it. Notices that arrive through the portal come in with these fields already authoritative; ones that arrive on paper or by email are keyed in here.

DOCUMENTS CALLED FOR

The list of documents a notice demands — read out of the PDF and turned into a checklist that feeds straight into a client document request. Editable before it goes anywhere.

On save, also...

Create the matter, schedule the hearing, and draft the client document request — the three things a notice always causes, offered at the moment the notice is filed rather than as three separate errands.

Notice queues, not a notice page

There is deliberately no practice-wide Notices menu item. The same records are surfaced three ways, each in the context that makes them actionable: the dashboard's two live queues, the awaiting-review card, and the assessee's own Notices tab. A fourth way in would be one more place to keep in step.

A notice is often a set of files

A s.148 arrives with its approval, the set note and the search print. Every screen that shows a notice shows **how many files came with it**, so nobody opens one and assumes that was all of it.

Ask for documents

From any notice row, one button drafts the client request with the called-for documents already listed — the shortest path from "this arrived" to "the client has been asked".

Every appealable order, already prepared

What the practice owes its clients after CPC has been through them

IT DRILLS DOWN, IT DOES NOT SPRAWL

A searchable list of **clients**, one row each, saying how much is at stake → that client's **orders**, one row per assessment year → one order's **full card**, in a pop-up. On a real practice, one flat page of every order is hundreds of rows deep and tells nobody where to start.

Two more ways to cut it

By cause — every client hit by the same CPC adjustment, together, so one answer can be written once and used many times. **By staff** — what each person is holding, and how much of it they have finished.

Every order carries a decision

Accept it, rectify it, or appeal it — recorded against the order, so the page is a place to work rather than a place to look. Rectification and appeal windows are computed on the same engine the Appeals page uses.

Red and green mean one thing, everywhere

Positive is money coming back to the assessee. A red figure means CPC left them worse off than the baseline; green, better. One sign convention, set once at ingest, so the dashboard number and the Returns-tab number cannot disagree.

Read the order

One button reads the comparison table inside a s.143(1) or s.154 order, and the earlier years' demand in its annexures. It can also run automatically for red-flagged orders — off by default, switched on in Settings.

What is deliberately absent

- **No client messaging from this page.** One sync can pull a dozen new PANs; a screen that could message off the back of that will one day message a dozen people nobody meant to contact.
- **No s.220(2) interest projection.** It would be our arithmetic sitting beside figures the department stated, and here the two must never be confusable.

Billing that lives beside the work that earned it

Raising a bill

Client, assessment year, service, line items and amount, with due date and status. Invoices are numbered by the practice's own series and always tied to an assessee on file.

Invoice PDFs, in your brand

Typeset with the firm's name, address and phone from the practice profile, an accent colour chosen from presets, and proper Indian numbering. Previewed before it is sent.

Sent on WhatsApp

Where the group head is reachable and has consented, the bill goes to them with the PDF attached and is tracked to **Read**. Where they are not, it comes back to the practitioner to forward — under a different template, so nobody is quietly unbilled.

Payments & receipts

Record part or full payment in cash, UPI, bank transfer, cheque or card. A numbered **receipt PDF** is produced for each. Payments can be entered against an invoice, an assessee, or a whole group — and allocated across open bills automatically.

Ledgers

A running statement of account per assessee and per group — invoices raised, payments received, balance carried — downloadable as a branded PDF for the client's own records.

THE PAGE ITSELF

- **Billing trend** over the last six months
- **Top outstanding**, sorted by due date
- The full invoice register with status pills
- **Assessee ledgers** panel
- **Groups** panel for family and business-house accounts

Why it belongs in this app

Receivables are grouped the way clients are grouped, and every bill points back at the matter that earned it. Collection stops being a separate memory exercise.

A document request is not a message. It is a checklist that sends messages.

Eight exports, each one row-counted before you click

Every report is a CSV that opens straight in Excel, generated from live data, with the row count shown on the card so nobody exports an empty file.

Outstanding receivables

Assessee-wise unpaid fees — invoice number, due date, amount, received, outstanding.

Billing report

Every invoice raised with its status, year, service and amount.

Payments received

Every invoice against which money has come in.

Authority-wise case load

Active matters by forum, with bench, section, status and the staff holding them.

Upcoming hearings

A cause list in spreadsheet form — date, time, assessee, PAN, A.Y., authority, bench, mode, staff.

Notice register

All notices with DIN, dates, section, authority and review status.

Assessee master

The full client register with contact details, group and assigned staff.

Communication log

Messages sent and drafted, by channel, with delivery status.

Plus targeted exports where the work happens: the Hearings page exports its filtered set directly, and Settings downloads a complete **JSON backup** of the practice — because data you cannot take out is data you do not own.

Profile, data, and every switch in one place

Practice profile

Your name, firm name, firm address and firm phone — the last two appear on every invoice and receipt PDF the app produces.

Account

The identity you signed in with, and **Link mobile** — attach and verify a mobile by OTP so phone and email become one account. That verified number is the only one ProHippo will ever WhatsApp or ring you on.

Your data

- **Download backup** as JSON
- **Load sample data** to explore the app safely
- **Clear all data**, behind a confirmation

LIVE INTEGRATIONS

- **Voice help line** — the number, what it can and cannot do, and Call me
- **Google Calendar** — connect, choose what mirrors, see last sync
- **ITAT email** — your practice's inbound address and its status
- **WhatsApp** — which of the six messages this practice sends
- **Auto-read** red-flagged intimations
- **Touch feedback** — haptics on mobile

Two permissions, kept separate

"Is this practice willing to send this message?" is a Settings switch. "Has this person agreed to receive it?" is recorded on the group head. Both must be true before anything is sent — one is a preference, the other is consent, and conflating them is how a client who said stop gets messaged anyway.

Announced, not yet live

Transactional email from your own domain, and Tally / Zoho Books invoice push — shown as coming, because a switch that does nothing is worse than no switch.

PART FOUR

The machinery behind the screens

Syncing, delivery, documents and the deliberate boundary around what a model is allowed to touch.

The morning's notices, in before anyone sits down

What it is

A desktop application for **macOS and Windows**, downloaded from inside ProHippo with OS-aware first-run instructions. It signs itself in from a device key held in the machine's keychain — issued from the app, revocable from the app — so no password is typed on a machine that runs unattended.

PARALLEL, AND ISOLATED

Several PAN syncs run at once, each inside its own isolated browser context with its own cookies and session — the desktop equivalent of the portal's own dual-login rule, but with every PAN a genuinely separate session, so portal sessions never collide.

Incremental by design

Before logging in, it reads what ProHippo already holds for that PAN, then fetches only what is new. A second sync is not a second download of the same four hundred files.

Unattended, on a timer that behaves

- Starts with the operating system and syncs once at launch
- Keeps going on a re-armed timer — every six hours by default — computed from the wall clock, so a laptop that slept through three of them syncs **once** on waking, not three times
- The next run is drawn from a range around the interval, so the portal never sees the same schedule two days running
- **Quiet hours** are respected
- It will not run while another sync is in flight, and never runs at all unless it was switched on

Paced to look like a person

Staggered, randomised launches and per-request jitter — because a firm's residential connection making four hundred identical requests in eight seconds is a firm that gets blocked. Runs the machine's real Chrome where it can.

Six messages, and the guards that stop the seventh

MESSAGE	GOES TO	FALLS BACK TO
Document request	Group head	The assessee's own mobile
New notice — practitioner	The practitioner	—
New notice — client	Group head	Not sent
Hearing reminder	The practitioner	—
Weekly cause list	The practitioner	—
Invoice	Group head	The practitioner, different template

Delivered, read, or failed — recorded

Every send is logged against the assessee with the status the provider reports, so "did the client get it" is a fact on file rather than a belief.

ONE NUMBER CARRIES EVERY PRACTICE

ProHippo is the sender; the practitioner's firm is named in the body. So a client who reports a message as spam does not damage that practice's deliverability — **they damage everyone's**. Consent, the opt-out list and the burst guards are not compliance theatre; they are what stops one careless practice taking the platform down for the rest.

Four guards on the new-notice alert

- Only notices whose deadline has **not already passed** — a first sync finds four years of history, and nobody wants to be alerted to all of it
- Only notices that came **from the portal** — not the one you just typed in
- A claim on the DIN, so the same notice cannot alert twice
- A **burst cap**, so a big sync cannot become a hundred messages

Into the diary the practitioner already keeps

GOOGLE CALENDAR

ProHippo creates **its own calendar inside the practitioner's Google account** and mirrors hearings and deadlines into it. Sync is **one-way by design**: ProHippo is the record of truth, and an event dragged in Google never silently moves a hearing here.

- Connect and disconnect from Settings, with the last sync time on screen
- Choose separately whether hearings and deadlines mirror
- Any single hearing can be kept out of the sync
- Uses the narrowest possible Google scope — the app can only touch the calendar it created, and can never read the practitioner's personal one

ITAT EMAIL INGEST

Each practice gets **one inbound address of its own**. Anything sent to it that came from the Tribunal is read — appeal number, appellant, PAN, assessment year, hearing date and time, bench, filing date, case type — and offered on the Hearings page for one click of confirmation.

- Register the address once with the Tribunal, or forward to it
- **Nothing reads anybody's mailbox** — there is no mail account to connect, no OAuth scope to grant and no annual security review
- A re-sent email cannot create a second matter
- A superseded hearing is marked adjourned rather than duplicated
- The sidebar badge counts what is waiting

A colleague who knows the whole app, on the phone

Ring **+91 80715 82778**, or press **Call me** in the app and it rings you.
Speak English, Hindi or Gujarati.

It can

- Find anything in the app — "where do I raise a bill", "how do I add a client"
- Read out your hearings, pending notices, open tasks and outstanding fees
- Summarise any one client — open matters, next date, what's due
- Answer in whichever of the three languages you speak

It cannot

- **Change anything.** It cannot add, edit, delete, send or file. It reads only.
- Give an opinion on a tax position — that stays with you.
- Tell you anything about ProHippo's own business, or any account but yours.

WHY "CALL ME" IS THE BETTER DOOR

The request arrives already authenticated, so ProHippo dials **the number that account verified** — never a number supplied in the request, which would turn the line into a free outbound dialler billed to us — and mints a signed token that lasts fifteen minutes, which is a call.

Inbound is identified before the conversation starts

The caller's number is resolved to an account the moment the call connects, and the same signed token is issued. If your mobile is not linked, the Settings card **tells you the line will not recognise you before you ring it** — which is the whole reason that card exists.

Every call is logged

Recent calls appear in Settings, so a practice can see what the line has been asked.

A computation sheet, generated from the return as filed

From the Returns tab, one click turns the ITR JSON already synced from the portal into a fully typeset **Computation of Income** PDF in the practice's brand — the document a client is given and a file is closed with.

Supported today

ITR-1	A.Y. 2022-23 to 2026-27
ITR-2	A.Y. 2022-23 to 2026-27
ITR-3	A.Y. 2022-23 to 2026-27
ITR-5	A.Y. 2025-26

A year without a mapper says so plainly, and names the years that do work — rather than offering a button that fails.

IT MUST TIE TO THE RETURN, OR IT DOES NOT PRINT

The generated document is **validated against the filed return** before it is rendered. If any head or total does not reconcile, generation fails loudly instead of handing over a computation that quietly disagrees with what was filed.

Deterministic, and specified

Same JSON in, same document out. No model, no network in the mapping — the only server call is the final render to PDF. The behaviour is written down in a specification the code is tested against; where the two disagree, **the specification wins and the code is wrong**.

Nothing is silently dropped

Fields the mappers do not yet handle are tracked rather than ignored, so an unmapped figure is a known gap, not an invisible one.

Where AI is used — and where it deliberately is not

A model is allowed to read a PDF. Nothing else.

- **Summarise an order** — and say which document it is: the assessment order, its computation sheet, or the notice of demand
- **Extract the documents a notice calls for**, to seed the client checklist
- **Read the comparison table** inside a s.143(1) or s.154 order
- **Translate our own sentences** into the client's language — with their details held back in placeholders. The letter itself is never sent to be translated.

Each of these extracts something a PDF is the **sole source** of. That is the entire test for admitting a model.

Everything else is arithmetic on stated facts

- A notice's PAN, assessment year, section, DIN and dates come from the **portal's own structured data** — not from reading the letter
- Appeal limitation, the applicable regime, fees and forms are **deterministic**
- The s.143(1) and s.154 variance is arithmetic on figures **the department stated**
- The Computation of Income is a specified mapping, validated against the filed return

Why draw the line here. A summary that is slightly wrong costs a second read. A **deadline** that is slightly wrong costs the appeal. The two must never be produced by the same kind of process — so in ProHippo they are not.

An earlier build let a model pre-fill the notice intake form from a PDF. It was removed once notices began arriving through the sync with their fields already authoritative: re-reading them cost money to produce a worse answer.

The security posture, stated plainly

Data is per-account, at the database level

Every record lives under the signed-in user. Firestore rules — not application code — deny any read across accounts. A bug in a screen cannot leak another practice's file.

Portal passwords

Encrypted at rest with a key held in Firebase secrets, never exposed to the browser, and deletable at any time. The key is not derivable from the stored data.

Sign-in

Mobile OTP, email OTP or Google. A mobile number becomes usable for WhatsApp and the voice line **only after it is proved by OTP** — never one typed into a form.

THE CONSOLE CANNOT SEE CLIENT DATA. EVER.

ProHippo's own admin console reads account-level facts — firm, plan, status, usage **counts**. It has **no access** to any practitioner's assessees, notices, hearings or portal credentials. Not "restricted" — the rules grant nothing there, and no server function reads it.

The console shows "12 assessees". It never shows **which twelve**.

Admin is a signed claim, not a flag

It is signed into the token, so the rules and every server function agree without an extra read — and nothing the browser can write can grant it. There is deliberately no self-service way to become an admin.

Every privileged action is audited

Account changes, role grants and referral reversals are written to an append-only audit log with who did what and when.

Device keys

The desktop Connector signs in with a key that is issued, stored in the OS keychain, and **revocable from the app** — so a lost office machine is one click, not a password reset across every client.

Your data leaves when you ask

A full JSON backup on demand, CSV exports across the practice, and a documented data-deletion route.

The business console, and how growth is attributed

/ADMIN — FIVE SCREENS

Overview	Accounts, paying, on trial, past due; new and active this week; live referral codes and attributed signups; a daily snapshot written at 02:30 IST.
Customers	Account lookup by firm or email — plan, status, usage counts.
Referral codes	Create, edit and reverse redemptions.
Costs	What the platform spends, tracked per service.
Audit log	Every privileged action, append-only.

It ships separately

Lazily loaded, so none of it lands in the bundle a practitioner downloads — and the link is drawn only for accounts carrying the claim. Everyone else has no link, no hint, and no route that resolves to anything but the normal app.

Referrals, on first touch

A partner sends someone to **prohippo.in/?ref=CODE**. That person reads the page, closes the tab, and signs up four days later from a Google search — and it still counts as the partner's signup.

- **First touch is never overwritten** — it credits whoever actually introduced the customer, and stops a coupon site intercepting attribution at the last second
- A **30-day window**, about as long as a professional takes to get round to signing up
- Codes are read off WhatsApp forwards and business cards, so case, spaces and hyphens do not matter
- The code is pre-filled and validated during onboarding, and attribution **never blocks a signup** — a bad code still lets the account through

PART FIVE

Why this, and why now

The argument in one page, the audience it is built for, and what comes next.

Six reasons this is the need of the hour

1 · Compliance became a machine. The response did not.

The Department issues, serves, processes and penalises automatically. A practice answering it with a browser tab and a diary is not slow — it is **structurally outmatched**.

2 · Service is deemed, so attention must be manufactured

Nobody is coming to tell you a notice arrived. Something has to go and look, every day, across every PAN — and then put it in front of a human. That is the product.

3 · Two limitation regimes now run at once

From 1 April 2026 the appeal clock changes shape, and which clock governs depends on when the order was communicated. Counting that by hand, across a full practice, for years — is exactly the kind of arithmetic that should never be done by hand.

4 · The cost of a miss is asymmetric and unrecoverable

A lapsed appeal is not an inconvenience; it is a client's assessment becoming final. Software that prevents one such lapse a year has already paid for itself many times over.

5 · Clients live on WhatsApp, in their own language

A reminder in an inbox nobody opens is not a reminder. ProHippo delivers where attention already is, in twelve Indian languages, with consent recorded and delivery tracked.

6 · The tooling finally exists to do this honestly

Portal data is structured enough to be fetched rather than guessed. Documents can be read where a PDF is the only source. And the parts that must never be wrong — limitation, fees, computations — can stay **fully deterministic and testable**. That combination was not available a few years ago. It is now.

Who it is for, and what it replaces

Chartered Accountants

In practice, carrying scrutiny, appeal and penalty matters across a client book of any size.

Tax advocates & consultants

Appearing before CIT(A) and the Tribunal, where limitation is the whole game.

Multi-partner firms

Where matters change hands and context is what gets lost at the handover.

Family & business-house advisors

Where a "client" is fifteen PANs and one person who answers for all of them.

GETTING STARTED

Sign in by mobile, email or Google → name your practice and firm (a referral code is pre-filled if you arrived on a partner link) → add an assessee, or **load sample data** and walk the whole app safely first.

What it replaces

A daily portal round	Automated sync, on demand or unattended
A diary and a whiteboard	Five calendar views, cause lists, Google mirror
Hand-counted limitation	A deterministic engine showing both regimes
WhatsApp scrollbar	Tracked requests with per-item status
A downloads folder	Every PDF attached to its proceeding
A separate billing book	Invoices, receipts and ledgers beside the matter
Excel registers	Eight live CSV exports and a full JSON backup

Honest state of the product

LIVE TODAY

- Portal sync — extension and desktop Connector
- Assesseees, groups, matters, notices, hearings
- Appeals limitation engine, both regimes
- Intimations & rectification variance
- All six WhatsApp messages
- Google Calendar mirror
- ITAT email ingest
- Voice help line, three languages
- Computation of Income — ITR-1/2/3/5
- Invoices, receipts, ledgers, groups
- Document requests in twelve languages
- Reports, backups, PWA install
- Admin console and referral attribution

NEXT

- Email attachments and a client upload link, so documents come back **into** the request rather than into an inbox
- Automatic reminders on outstanding checklist items
- Transactional email from the practice's own domain
- More ITR forms and years for the computation
- Plans, entitlements and billing

THE PRINCIPLES THAT WILL NOT MOVE

- Anything that must never be wrong stays **deterministic and tested**
- A model reads documents; it does not decide dates
- Consent and delivery are **recorded facts**, not assumptions
- ProHippo's own staff cannot see a practitioner's client data
- Nothing writes itself from an untrusted source without a human confirming
- A practice can take its data out at any time

PROHIPPO

Deadline anxiety has a new ending.

Every alert, hearing, reply, order and appeal stays connected to the matter that created it.
Never unseen. Never too late.
